Moving On

Overreaction to a substance can be considered an allergic reaction. There is a theory that, over time, the body becomes “used to” the substance or substances, and that the levels of sensitivity may become reduced or entirely eliminated. It is unknown as to why an allergy may seem to disappear. In some cases, the severity of the reaction may vary subject to the season. However, even if it appears that allergic reactions are no longer occurring, it is important to continue to monitor your status with your allergist since some allergies may return unannounced. Allergy treatment regimens should be maintained, and updates regarding your condition and symptoms should be reported to your allergist.

Allergies lead to recurrent symptoms of sneezing, itching, and restricted breathing. These overreactions may extend to more serious consequences. Seek the help of an experienced medical specialist and contact THE WILLIAM STORMS ALLERGY CLINIC today. Call 719-955-6000 for a consultation or for more information. We're located 1625 Medical Center Point, Suite 190 or visit us at www.stormsallergy.com. We welcome patients of all ages.

HINT: Allergic reactions can vary widely in their severity.
